

LISTING OF CLAIMS

Claim 1 (Currently Amended): An electrophotosensitive material comprising a conductive substrate and a photosensitive layer provided on the conductive substrate, wherein the photosensitive layer contains a ~~polyallylate~~ polyarylate having a repeating unit represented by the general formula (1):

in the formula (1), X represents any of divalent groups represented by the formulas (b) or (c):

and R^1 and R^2 are the same or different and represent an alkyl group having 1 to 3 carbon atoms, and a hole transferring material having a triphenylaminostyryl group represented by the general formula (h1):

in the formula (h1), R^{ha} and R^{hc} are the same or different and represent an alkyl group having 1 to 8 carbon atoms, an alkoxy group having 1 to 8 carbon atoms, or an aryl group having 12 or less carbon atoms and, in case two or more of the substituents R^{ha} and R^{hc} are substituted on the same benzene ring, the substituents R^{ha} and R^{hc} substituted on adjacent carbon atoms may be combined with each other to form a saturated or unsaturated hydrocarbon ring, and a represents an integer of 0 to 3, in the molecule.

Claim 2 (Original): The electrophotosensitive material according to claim 1, wherein the substituents R^1 and R^2 in the repeating unit represented by the general formula (1) are methyl groups.

Claim 3 (Currently Amended): The electrophotosensitive material according to claim 1, wherein the photosensitive layer is a single layer and the layer contains the polyallylate polyarylate of claim 1 and at least an electric charge generating material and an electric charge transferring material.

Claim 4 (Currently Amended): The electrophotosensitive material according to claim 1, wherein the photosensitive layer is a laminate of two or more layers, and a layer containing the ~~polyallylate~~ polyarylate of claim 1 among two or more layers is an outermost layer of the photosensitive layer and is a layer containing no electric charge generating material.

Claim 5 (Cancelled)
